INT

Smart interior blinds

HELI IQ INT recognizes
day and night,
as well as the intensity
of sunlight, and can
react intelligently
to sudden events

The sun
in the main role

Heli-

INT

Thanks to smart sensors and an artificial intelligence system, it always ensures perfect thermal and lighting comfort in every home.

It works independently of any infrastructure or networks. It gets the energy it needs to function from diffused daylight. It works reliably even in north-facing windows and doors.

Extremely energy-efficient operation. Thanks to the integrated solar cell, it will keep running for many years. Without the solar cell, the battery lasts up to 6 months at a time.

It can be easily integrated into advanced automatic shading functions of existing apartments and houses and can be connected to smart home systems (Loxon, Mediola and others).

Smart light sensors determine the time of day and season

Integrated solar panel for full solar power

Integrated AI system for learning external conditions

It does not need any higher-level control system to function

Easy and quick installation without drilling and wiring.
